- Two saw wave oscillators. - A detune control. - The reason for this tool is to easily turn the deep beat from Phat Bass Product Key into your track. It's a must have tool for trap producers. To use the tool just drag the track from your preferred audio track and use the DSP Filters to tame any unwanted sounds in the signal. In the INFO tab you can set the phase of the saw waves, the detune and the cutoff frequency. The DETUNE control lets you use separate controls for each oscillator to easily reach different tones. A wound dressing comprising an absorbent padding material of gelatin incorporated in the web, which is permeable to aqueous fluids and which is capable of sustaining hydration to an extent sufficient to provide occlusive protection to the wound without significant impairment of the barrier function of the skin is described in Wilton U.S. Pat. No. 3,156,667. This gelatin dressing is a film which is adhered to the wound, and the film comprises a permeable web of gelatin impregnated with an aqueous solution of gelatin, whereby the gelatin acts as a support for hydration of the padding material. Although this prior absorbent gel packing is operable, a number of problems are encountered in working with gelatin. For example, gelatin is difficult to work with because of its high viscosity and cohesiveness. It is sometimes difficult to obtain a uniform coating of the liquid gelatin upon the web due to its unacceptably high viscosity. Furthermore, a number of the prior gelatin gel packs are subject to delamination. In addition, the pad material, such as gauze, or foam padding has been adhered directly to the web of gelatin which may result in causing premature drying out of the padding material. Finally, it is difficult to maintain the gel pack in a desired shape for packing the wound. In addition, U.S. Pat. No. 3,712,835 to Wilton discloses an intraparenchymal seal dressing for the compression of brain tissue. This dressing comprises a fibrous material embedded in a wicking material, the dressing being placed in the brain tissue to prevent formation of blood clots at the intraparenchymal cavity sites. U.S. Pat. No. 6a5afdab4c
